

Tuckline: Connecting Tuckshops of LPU

Transforming the Tuckshops inside our college.

Profile of the problem

In a university environment, students and faculty frequently require stationery supplies for academic and administrative purposes. However, the traditional method of purchasing stationery involves manually searching for products across different stores, leading to inefficiencies such as time wastage, stock unavailability, and difficulty in comparing prices. Additionally, students often face challenges in locating shops, tracking inventory status, and managing their stationery needs effectively.

Idea Proposed in the Project:

The AIM

The Smart Campus Stationery Management System aims to revolutionize the way students and faculty access stationery supplies within a university campus by introducing a centralized digital platform.

Unique Features of this Project:

- 
1. The system provides real-time inventory tracking, allowing users to check product availability instantly across all campus stores.
 2. Users can compare prices of stationery items from different shops, ensuring they get the most cost-effective option.
 3. A user-friendly web application that is easily usable.
 4. Data analytics provide shop owners with insights into inventory management and sales trends for better business decisions.
- 

Modules that are implemented

1. Homepage (Main Interface): The central hub where users interact with the system, access all services, browse available stationery, and navigate through the platform.
 2. Services Page: Displays the complete catalog of stationery items available in campus stores. Users can check product details, compare prices, place orders, and make online payments directly from this page.
 3. Contact Page: Provides users with essential contact details, including support information, FAQs, and a help desk for queries and assistance.
 4. Our Team Page: Showcases the team behind the project, highlighting their roles, expertise, and contributions to the development of the system.
